

Breast Cancer is a major health risk to all women because when it is undetected and uninterrupted, it silently grows and destroys. Scientific studies show that it can take 8-10 years to develop into something we can feel or even see with conventional screening. To make matters worse, there are some types of cancers that may not form a lump. Not all women will develop the condition but, for those who do, the sooner it can be detected the more options they will have.

The technology does exist and it is in the Houston area. Digital Infrared Thermal Imaging (DITI), also known as Thermography, is a highly sensitive technology that can detect abnormalities or changes in body temperature. Research shows Thermography can detect irregular patterns and early stage cancers 7-10 years before a mammogram. Best of all, Thermal Imaging has no painful compression, is non-invasive, and has no radiation. Why wait for something suspicious? Be proactive and schedule your Thermography scan today.

Special Internet Coupon!

Take \$25.00 off your initial breast scan at Thermography of Houston. (New clients only, please). Coupon may only be used at the Lake Road location. Not valid with any other offer.

This offer expires on 12-31-2011.

Early detection and prevention saves lives.
